Subject: **BENDIX LOADED CALIPER L55250M
OBSOLETE & SUPERSEDED**

Beginning April 1, 1995, the L55250M will be obsolete and superseded by L55250LM and L55250RM. The "L" and "R" preceding the "M" in the part number indicate Left and Right. The change from a universal to specific left and right calipers is necessary because of a change in the disc pads used. One edge of the outer pad used in MK225HD is now chamfered, creating a distinct right and left side outer pad. Because Bendix is the OE supplier of these disc pads, and now uses OE grade friction in its medium duty loaded calipers, it is necessary to offer a right and left side loaded caliper.

Ideally calipers with chamfered pads (L55250LM & L55250RM) should be used on both sides of an axle. However, a caliper with a non-chamfered pad (L55250M) can be used with either a left or right caliper with a chamfered pad. As your inventories of the L55250M become depleted, be sure to order both L55250LM and L55250RM to ensure complete coverage.
