Subject: **Bendix Does Not Advocate Reuse of Oil-Contaminated Friction Materials**

To ensure optimum braking performance, when brake friction materials are found to be contaminated by oil, Bendix DOES NOT approve *power-washing or chemical cleaning as a remedy*. In all circumstances, we specifically advise that the friction material BE REPLACED.

To maintain brake balance it is very important to also replace the friction material — the oil-contaminated as well as non oil-contaminated — at both ends of the axle, and to use exactly the same friction material.
